

Serial monitor outputs:

```
hi: 0.730579  
sup: 0.269421
```

```
hi: 0.364151  
sup: 0.635849
```

Issue fixed: When compiling the module, the original loss function used was mse and mae as metrics, but these are used for regression, not classification. Since this model is used for classification, we want to change these to categorical\_crossentropy and accuracy, respectively.

To make the notebook consistent, I had to change mae plot to an accuracy plot by changing the key name.
