Task 3 Screenshots:

Reflection:

I notice that the first model performed better for the most part. I think that this has to do with the training data. Our stroke data that we collected personally may be flawed due to the difficulty we had successfully capturing it. Also, if one of us made a mistake labeling it, then that will impact the model's accuracy severely. So in this case, fine tuning did not help because our "gesture style" simply ended up being less precise / clean gestures.
